

CUSTOM DRYER SUPPRESSION SYSTEMS, LLC

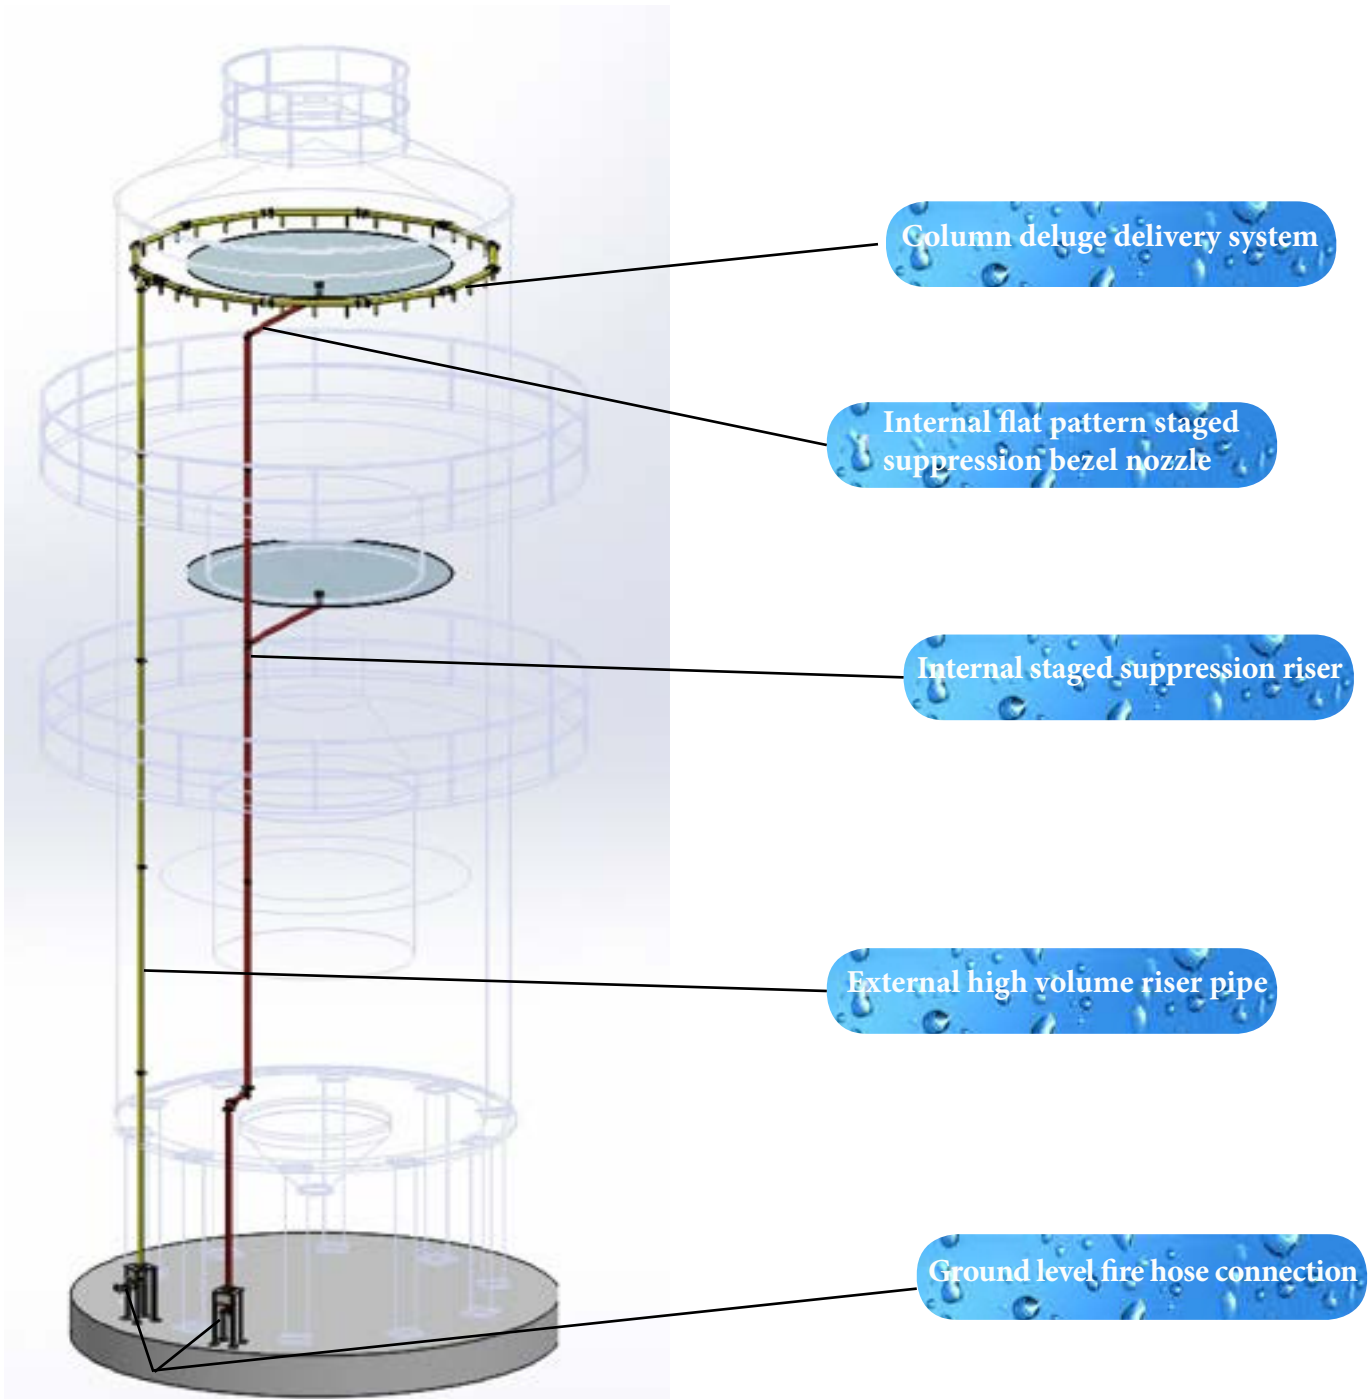

COMMERCIAL GRAIN DRYER SUPPRESSION SYSTEM

The CDS Systems' patent-pending design provides high volumes of water on demand to the plenum as well as the columns and gives operators and emergency support personnel the ability to provide water where needed.

The CDS Systems are designed to provide effective and safe efforts to minimize structural damage and allows the hazard to be managed from a safe distance.

The CDS Systems are design specific to fit any grain dryer and provides for ease of installation.

Jeffery A. Wellman, a 35-year career firefighter states:

“In grain dryer fires typically the product along with the dryer is lost. I have witnessed the testing of the Grain Dryer Suppression System that CDS Systems has developed. Water was rapidly and effectively applied internally from top to bottom in a full grain column without putting personnel in a confined and hazardous space. This tool has not been available for the firefighter. I believe it could be the solution to saving the farmer, grain facility, and the insurance industry from suffering large losses.”
